## **(PDF) BASIC TECHNIQUES IN ANIMAL CELL CULTURE**

Such applications, which are also called "new plant breeding techniques" (NPBT), are different to both conventional breeding approaches as well as standard GM developments (L USSER et al. 2012).

These alternatives to animal testing include sophisticated tests using human cells and tissues (also known as in vitro methods), advanced computer-modeling techniques (often referred to as in silico models), and studies with human volunteers. These and other non-animal methods are not hindered by species differences that make applying animal test results to humans difficult or impossible, and they usually take less time and money to complete.

## **Alternatives to Animal Testing | PETA**

separate animals from their social groups for these procedures is reduced (Bloomsmit,1992). Positive Reinforcement Training Techniques The following are a selection of training techniques that are valuable in a variety of management situations for non-human primates in a biomedical setting.

## **THE USE OF POSITIVE REINFORCEMENT TRAINING TECHNIQUES TO**

Clones of adult animals are created by the processes of artificial twinning and somatic cell nuclear transfer. There are two variations of the somatic cell nuclear transfer method. They are the Roslin Technique and the

Honolulu Technique. It is important to note that in all of these techniques the resulting offspring will be genetically identical to the donor and not the surrogate unless the donated nucleus is taken from a somatic cell of the surrogate.

### **The Different Types of Cloning Techniques - ThoughtCo**

The use of substances and techniques restoring product quality that has been lost through processing and storage of organic food and feed, or even through negligence in the processing of the products (e.g. : nanotechnology).
