

### **principles of polymerization pdf**

Chain-growth polymerization or chain polymerization (IUPAC recommended term) is a polymerization mechanism in which monomer molecules add onto the active site of a growing polymer chain one at a time. Growth of the polymer occurs only on the active sites on the chain, which are typically at the chain-end(s).

### **Chain-growth polymerization - Wikipedia**

Living polymerization: A chain polymerization from which chain transfer and chain termination are absent. Note: In many cases, the rate of chain initiation is fast compared with the rate of chain propagation, so that the number of kinetic-chain carriers is essentially constant throughout the polymerization.

The huge difference in reactivity of the tertiary mid-chain radical compared to the secondary end-chain radical results in a number of complications, both in terms of kinetics and polymer microstructure, which continue to be the source of discussion in the literature.
