

### **proteasome inhibitors in cancer pdf**

The proteasome subcomponents are often referred to by their Svedberg sedimentation coefficient (denoted S). The proteasome most exclusively used in mammals is the cytosolic 26S proteasome, which is about 2000 kilodaltons (kDa) in molecular mass containing one 20S protein subunit and two 19S regulatory cap subunits.

CDK4/6 inhibitors are among a new generation of therapeutics. Building upon the striking success of the combination of CDK4/6 inhibitors and the hormone receptor antagonist letrozole in breast cancer, many other combinations have recently entered clinical trials in multiple diseases.

As researchers have learned more about the changes in cells that cause cancer, they have been able to develop newer drugs that specifically target these changes.

Cathepsin G is a protein that in humans is encoded by the CTSG gene. It is one of the three serine proteases of the chymotrypsin family that are stored in the azurophil granules, and also a member of the peptidase S1 protein family.

Hypoxia-inducible factor-1 (HIF-1) has been recognized as an important cancer drug target. This review summarizes the role and regulation of the HIF-1 in cancer and recent therapeutic approaches targeting this important pathway.

Les expressions cancer du poumon et cancer bronchique désignent au sens strict une tumeur maligne du poumon, et par extension les carcinomes pulmonaires, qui regroupent les tumeurs malignes épithéliales du poumon.

Different molecular mechanisms of NF- $\kappa$ B activation have been proposed (Fig. 1) [2, 20]. In the so-called canonical or classical NF- $\kappa$ B pathway, dimers contain either RelA or c-Rel, together with p50.

LC3 (microtubule-associated protein light chain 3), the most studied autophagy biomarker, was originally identified as a subunit of microtubule-associated proteins 1A and 1B (MAP1LC3) and was later found to contain similarity to yeast protein Apg8/Aut7/Cvt5.
